

Last Modified: 2024

Nestor Hotel, we believe that the World is a huge family. We appreciate time, nature and energy sources and thus use all types and possibilities that technology has to offer in a way that does not harm nature.

We invite you to join us on this journey to the heart of nature, a World where loyalty to nature comes to life and we expect you to support us from your heart, following our environmental awareness and our service understanding.

We have set an environmental policy that enables us to contribute to the ecological balance to present clean and sufficient resources for future generations. We have been amounting and its elimination or the reduction of energy consumption and will continue with this work.

Our aim is leaving an environment with sufficient resources to future generations. Our understanding of environmental protection is to reduce the consumption of natural resources by keeping damage to soil, water, and air and any risk to environment at its minimum.

We intervene in the unnecessary and excessive use of resources by monitoring the consumption of water, energy, and chemical materials.

We support infrastructural planning by monitoring and controlling the amount of solid waste production.

As we sort out solid waste and hand on to recycling we avoid unnecessary energy use and thus pollution by primary production.

Hazardous waste such as batteries, toner, inkjet, cartridges, oils, electronic Office supplies are stored in specially built hermetic areas. Such waste is passed on to Hazardous Waste Operators.

- **ENERGY SAVING**

Saving in heating and cooling. Decrease in the global warming! By using double-glazing in the rooms and restaurants we do not only spend 20% less energy in heating and cooling. But also make a contribution to reduce global warming.

Heat regulation – adjustment

The temperature in each room is under thermostatic control and can be adjusted independently. Minimum energy consumption with energy-saving air conditioners!

The rooms are equipped with a system that turns off electricity supply after the guests have left the room designed saving in lighting!

A specially designed lighting system enables us to avoid unnecessary lighting and to achieve the highest level of energy saving using lamps of class A.

Sufficient lighting when necessary.

We can prevent the loss of even a single light beam by using lights with motion sensors in general areas.

Advanced technology to save more energy.

We prevent power surges by using frequency inverter in air-conditioners as well as in water boosters. Heat pumps allow us to reduce energy consumption to a minimum.

- **WATER SAVING**

We avoid unnecessary water consumption by using special water taps and shower heads with water pressure regulation or water taps, shower heads and urinals working with photocells and time control.

Low – volume reservoirs reduce the consumption of toilet waste water, so that the already limited water sources are kept under control. We train our personnel no notice and prevent the leakages in the room toilets, and expect also from our guest to inform us if they notice such leakages.

Both comfort and water saving!

We offer you low shower cabinets were you can enjoy your shower in a spacious area and consume less water at the same time.

Being a natural part of environment!

Our garden which is in harmony with nature is only watered during night-time with dropping and sprinkler systems. Thanks to this system we avoid the excessive consumption of water and its vaporization.

- **AVOID CHEMICALS**

Water, chemical and energy saving in one!

To limit the water consumption for cleaning towels and linens, we change them in cooperation with our guests and only on their demand.

For the health of man and nature, minimum quantity in chemical consumption!

The consumption of disinfectant chemicals that we use in our pools is held under control by an automatic dosing system.

The ants accommodate and feed many other arthropod species in their homes. The key of this hospitality is the capability of both the guest and the host to communicate.

Thank you for not smoking!

All of our rooms are non-smoking areas and thus we help to protect the health.

We inform our guest about public transportation and encourage them to make use of it.

All detergents that we use for cleaning. Dishwashing (manual and dishwasher) and for general cleaning are biologically degradable.

Biofuel production from used vegetable oils!

We save used vegetable oils and pass them on to special companies for free where they do the processing into biofuel.

- **COMPATIBILITY WITH NATURE AND CONSCIOUSNESS OF PARTICIPATION**

Maintenance and repair helps us to control environmental risks. The maintenance and repair of all equipment's used in the operation is carried out according to law and regulations.

Energy and measuring!

To calculate the expenses of the responsible departments and devices in the operation, we installed water and energy meters. This allows us to measure the consumption of our restaurant and bars. The results recorded in a report.

Adoption of our corporate culture and mission by all our employees!

For our employees we set an education plan with employee manual and seminars in which we explain our work of environment protection – this education will also enhance their participation and increase their productivity.

The most valuable concept is 'development of awareness'

By including such as 'the ecological equilibrium', the rational use of natural resources and environmental protection in our Daily animation activities we support our children acquire and develop awareness for environment.

Be prepared against risks and threats!

Since we are in the vicinity of a forest area, our staffs are regularly trained in fire safety measures. Thus in the event of a fire the necessary steps can be immediately taken.

- **WASTE REDUCTION AND RECYCLING**

'No' to fast consumption, 'Yes' to local production!

We try to avoid as much as possible disposable packages and products in our restaurants and bars; emerging waste is stored and then passed on to licensed hazardous waste operators for recycling. Free of charge. We also support organic production by using raw materials with eco-labels for the production of alternative food and beverage.

Waste separation by our guests

In common areas we have sorting points where our guests can separate their waste. On the hotel floors we also provide special boxes for used batteries and medical waste.

It is not only recycling but also support to society!

Each year we continue to add value to production by donating all recyclable commodities to recycling stations, to schools or charity foundations.

Neutrality is hidden in the detail!

By using environmentally friendly materials for renovation or repair work we give an enormous effort to bring all details in harmony with nature.
